# No Verification Enrolment / Pseudonymous

1. The User selects the client site Login link or button

2. Request that the user registers for site access, this would be any identity string as chosen by the user

3. Enrolment means using the mPINPAD to ask the user to type their PIN, and then ask them to type it again to confirm their choice

4. Process End, user has access to the site/resource

5. Many services that use this form of enrolment allow the user to add verification data later. So the user will initially be registered and enrolled but could be anyone; later that (same) user could be identified through verification
